Advice to users of AUTOSAR Specification Documents:

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction and functional overview

This specification describes the functionality, API and configuration of the AUTOSAR Basic Software Module "Memory Abstraction Interface" (MemIf). This module allows the NVRAM manager to access several memory abstraction modules (FEE or EA modules) (see Figure 1).

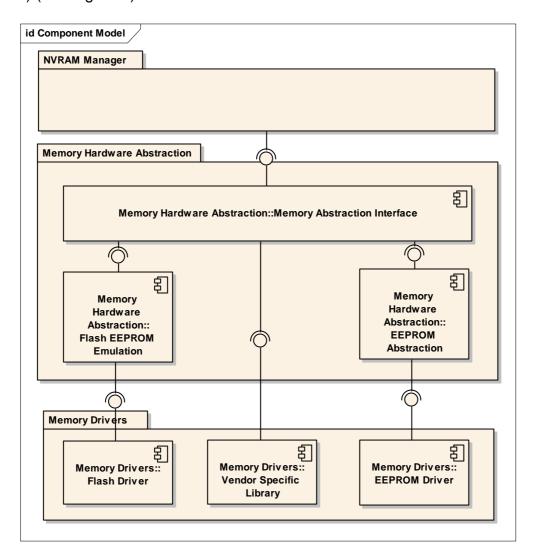

Figure 1: Module overview of memory hardware abstraction layer

MemIf001: The Memory Abstraction Interface (MemIf) shall abstract from the number of underlying FEE or EA modules and provide upper layers with a virtual segmentation on a uniform linear address space.

2 Acronyms and abbreviations

Acronyms and abbreviations which have a local scope and therefore are not contained in the AUTOSAR glossary must appear in a local glossary.

Abbreviation /	Description:
Acronym:	
EA	EEPROM Abstraction
EEPROM	Electrically Erasable and Programmable ROM (Read Only Memory)
FEE	Flash EEPROM Emulation
LSB	Least significant bit / byte (depending on context). Here it's bit.
MemIf	Memory Abstraction Interface
MSB	Most significant bit / byte (depending on context). Here it's bit.
NvM	NVRAM Manager
NVRAM	Non-volatile RAM (Random Access Memory)
Fast Mode	E.g. during startup / shutdown the underlying driver may be switched into fast mode in order to allow for fast reading / writing in those phases.
	Note: Whether this is possible depends on the implementation of the driver and the capabilities of the underlying device. Whether it is done depends on the configuration of the NVRAM manager and thus on the needs of a specific project.
Slow Mode	During normal operation the underlying driver may be used in slow mode in order to reduce the resource usage in terms of runtime or blocking time of the underlying device / communication media.
	Note: Whether this is possible depends on the implementation of the driver and the capabilities of the underlying device. Whether it is done depends on the configuration of the NVRAM manager and thus on the needs of a specific project.

4 Constraints and assumptions

4.1 Limitations

No limitations.

4.2 Applicability to car domains

No restrictions.

5 Dependencies to other modules

5.1 File structure

5.1.1 Code file structure

MemIf033: The code file structure shall not be defined within this specification.

5.2 Header file structure

MemIf002: The file include structure shall be as follows:

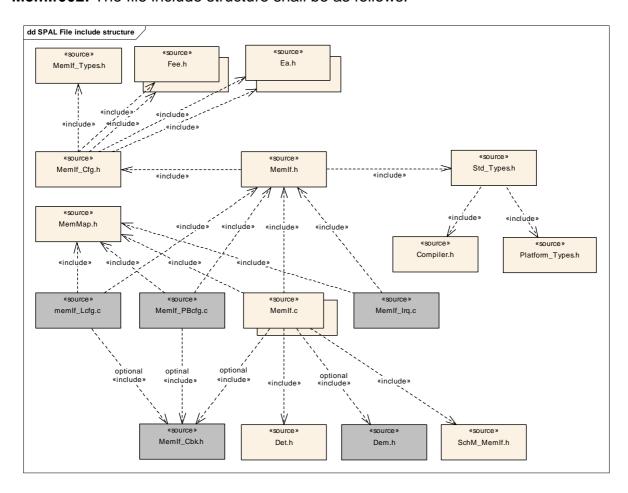

Figure 2: Memory Abstraction Layer File Include Structure

- MemIf_Cfg.h shall include MemIf_Types.h and the header files of all underlying memory abstraction modules (FEE and EA modules)
- MemIf.h shall include Std_Types.h and MemIf_Cfg.h
- Only MemIf.h shall be included by the upper layer modules
- MemIf.c (if implemented) shall include MemIf.h, MemMap.h and other standard header files (if needed by the implementation)..

- Fee_x.h shall include MemIf_Types.h and the header file of the underlying flash driver
- Ea_y.h shall include MemIf_Types.h and the header file of the underlying EEPROM driver

MemIf034: The module shall include the Dem.h file. By this inclusion the APIs to report errors as well as the required Event Id symbols are included. This specification defines the name of the Event Id symbols which are provided by XML to the DEM configuration tool. The DEM configuration tool assigns ECU dependent values to the Event Id symbols and publishes the symbols in Dem_IntErrId.h.

6 Requirements traceability

BSW14025 Efficient implementation	Memlf019, Memlf020

7 Functional specification

7.1 General behavior

MemIf005: All pre-compile time configuration parameters shall be checked statically (at least during compile time) for correctness. The version information in the module headers and source files shall be validated and consistent (e.g. by comparing the version information in the module headers and source files with a pre-processor macro).

7.2 Error classification

MemIf029: Values for production code Event Ids are assigned externally by the configuration of the Dem. They are published in the file Dem_IntErrId.h and included via Dem.h.

Memlf030: Development error values are of type uint8.

MemIf006: The following errors and exceptions shall be detectable by the Memory Abstraction Interface depending on its configuration (development/production):

Type or error	Relevance	Related error code	Value [hex]
API service called with wrong	Development	MEMIF_E_PARAM_DEVICE	0x01
device index parameter			

7.3 Error detection

MemIf007: The detection of development errors shall be configurable (on/off) at precompile time. The switch MemIfDevErrorDetect (see chapter 10) shall activate or deactivate the detection of all development errors.

MemIf008: A detection of errors not listed in the table above [MemIf006] shall not be implemented.

7.4 Error notification

MemIf028: Development errors shall be reported to the Development Error Tracer (DET) if the preprocessor switch MemIfDevErrorDetect is set. The error codes shall not be used as return values for the called function.

8 API specification

8.1 Imported types

8.1.1 Standard types

In this chapter all types included from the following files are listed:

Memlf037:

Header file	Imported Type	
Std_Types.h	Std_VersionInfoType	
	Std_ReturnType	

8.2 Type definitions

MemIf009: The types specified in this chapter shall be located in the file MemIf_Types.h.

MemIf010: The types specified in this chapter shall not be changed or extended for a specific memory abstraction module or hardware platform.

MemIf011: The data type for the memory device index shall be uint8. The lowest value to be used for this device index shall be 0. The allowed range of indices thus shall be 0. MemIfNumberOfDevices-1.

MemIf036: The symbolic name MEMIF_BROADCAST_ID shall be used to identify all underlying devices within one call. This special "broadcast" device ID shall only be allowed in the call to MemIf_GetStatus to determine the status of all underlying abstraction modules and device drivers¹.

8.2.1 Memlf StatusType

Name:	MemIf_StatusType	
Туре:	Enumeration	
Range:		The underlying abstraction module or device driver has not been initialized (yet).
		The underlying abstraction module or device driver is currently idle.
		The underlying abstraction module or device driver is currently busy.
		The underlying abstraction module is busy with internal management operations. The underlying device driver can be busy or idle.

¹ I.e. used to query whether all devices are idle in order to shut down the ECU.

Description:	Denotes the current status of the underlying abstraction module and device drive.
--------------	---

MemIf015: The type MemIf_StatusType denotes the current status of the underlying abstraction module and device driver. It shall be used as the return value of the corresponding driver's "GetStatus" function.

8.2.2 Memlf_JobResultType

Name:	MemIf_JobResultType	
Туре:	Enumeration	
Range:		The job has been finished successfully.
	MEMIF_JOB_FAILED	The job has not been finished successfully.
	MEMIF_JOB_PENDING	The job has not yet been finished.
	MEMIF_JOB_CANCELLED	The job has been cancelled.
	MEMIF_BLOCK_INCONSISTENT	The requested block is inconsistent, it may contain
		corrupted data.
		The requested block has been marked as invalid,
		the requested operation can not be performed.
Description:	Denotes the result of the last job	

MemIf016: The type MemIf JobResultType denotes the result of the last job.

8.2.3 MemIf_ModeType

Name:	MemIf_ModeType
Туре:	Enumeration
Range:	MEMIF_MODE_SLOW The underlying memory abstraction modules and drivers are
	working in slow mode.
	MEMIF_MODE_FAST The underlying memory abstraction modules and drivers are
	working in fast mode.
Description:	Denotes the operation mode of the underlying abstraction modules and device
	drivers.

MemIf021: The type MemIf_ModeType denotes the operation mode of the underlying abstraction modules and device drivers.

8.3 Function definitions

MemIf017: The API specified in this chapter shall be mapped to the API of the underlying memory abstraction modules. For functional behavior refer to the specification of those modules respectively to that of the underlying memory drivers.

MemIf018: The parameter DeviceIndex shall be used for selection of memory abstraction modules (and thus memory devices). If only one memory abstraction module is configured, the parameter DeviceIndex shall be ignored.

MemIf019: If only one memory abstraction module is configured, the Memory Abstraction Interface shall be implemented as a set of macros mapping the Memory

Abstraction Interface API to the API of the corresponding memory abstraction module.

Example:

MemIf020: If more than one memory abstraction module is configured, the Memory Abstraction Interface shall use efficient mechanisms to map the API calls to the appropriate memory abstraction module. One solution is to use tables of pointers to functions where the parameter <code>DeviceIndex</code> is used as array index.

Example:

Note: The service IDs given in this interface specification are related to the service IDs of the underlying memory abstraction module(s). For that reason, they may not start with 0.

MemIf022: If more than one memory abstraction module is configured and development error detection is enabled for this module, the parameter <code>DeviceIndex</code> shall be checked for being an existing device or the broadcast identifier within the module's services.

MemIf023: Detected errors shall be reported to the Development Error Tracer (DET) with the error code MEMIF_E_PARAM_DEVICE and the called service shall not be executed.

MemIf024: If the called function has a return value, it shall be set as follows:

MemIf_GetStatus: MEMIF_UNINIT
MemIf_GetJobResult: MEMIF_JOB_FAILED

All other functions: E_NOT_OK.

MemIf035: If the function MemIf_GetStatus is called with the device index denoting a broadcast (MEMIF_BROADCAST_ID) to all configured devices (see MemIf036), this module shall call the "GetStatus" functions of all underlying devices in turn. It shall return the value

- MEMIF IDLE if all underlying devices have returned this state
- MEMIF_UNINIT if at least one device returned this state, all other returned states shall be ignored
- MEMIF_BUSY if at least one configured device returned this state and no other device returned MEMIF_UNINIT
- MEMIF_BUSY_INTERNAL if at least one configured device returned this state and no other device returned MEMIF_BUSY or MEMIF_UNINIT

8.3.1 Memlf_SetMode

Memlf038:

Service name:	Memlf_SetMode
Syntax:	<pre>void MemIf_SetMode(</pre>
	MemIf_ModeType Mode
Service ID[hex]:	0x01
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	Mode
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	map function calls of MemIf_SetMode to service: Fee_SetMode respectively
	Ea_SetMode

MemIf049: The function MemIf_SetMode shall be mapped to service: Fee_SetMode respectively Ea_SetMode.

Note: The device index was intentionally left out in the above function, that is the Memory Interface shall switch all underlying modules into the requested mode. An extra "broadcast" parameter is not needed in this case since the devices shall not be switched to different modes individually.

8.3.2 MemIf_Read

Memlf039:

Service name:	Memlf Read	
Syntax:	Std_ReturnType MemIf_Read(
	uint8 DeviceIndex,	
	uint16 BlockNumber,	
	uint16 BlockOffset,	
	uint8* DataBufferPtr,	
	uint16 Length	
Service ID[hex]:	0x02	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
	DeviceIndex	
Paramatara (in)	BlockNumber	
Parameters (in):	BlockOffset	
	Length	
Parameters	None	
(inout):		
Parameters (out):	DataBufferPtr	
Return value:	Std_ReturnType	
Description:	map function calls of MemIf_Read to service: Fee_Read respectively Ea_R	ead

MemIf050: The function MemIf Read shall be mapped to service: Fee Read respectively Ea_Read.

8.3.3 MemIf_Write

Memlf040:

Service name:	MemIf_Write	
Syntax:	Std_ReturnType MemIf_Write(
	uint8 DeviceIndex,	
	uint16 BlockNumber,	
	uint8* DataBufferPtr	
Service ID[hex]:	0x03	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
•	DeviceIndex	
Parameters (in):	BlockNumber	
	DataBufferPtr	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	Std_ReturnType	
Description:	map function calls of Memlf Write to service: Fee Write respectively Ea W	rite

MemIf051: The function MemIf_Write shall be mapped to service: Fee_Write respectively Ea_Write.

8.3.4 MemIf_Cancel

Memlf041:

Service name:	Memlf_Cancel	
Syntax:	void MemIf_Cancel(
	uint8 DeviceIndex	
Service ID[hex]:	0x04	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	DeviceIndex	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	None	
Description:	map function calls of MemIf_Cancel to service: Fee_Cancel respectively	
	Ea_Cancel	

MemIf052: The function MemIf_Cancel shall be mapped to service: Fee_Cancel respectively Ea_Cancel.

8.3.5 MemIf_GetStatus

Memlf042:

Service name:	Memlf_GetStatus
Syntax:	MemIf_StatusType MemIf_GetStatus(
	uint8 DeviceIndex

Service ID[hex]:	0x05	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	DeviceIndex -	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	MemIf_StatusType -	
Description:	map function calls of MemIf_GetStatus to service: Fee_GetStatus respectively	<i>y</i>
	Ea_GetStatus	

MemIf056: The function MemIf_GetStatus shall be mapped to service: Fee_GetStatus respectively Ea_GetStatus

Note: In case the parameter given as device ID is MEMIF_BROADCAST_ID, the memory abstraction interface shall iterate over all underlying devices and return their combined statusn according to MemIf035.

8.3.6 Memlf_GetJobResult

Memlf043:

Service name:	Memlf_GetJobResult	
Syntax:	MemIf_JobResultType MemIf_GetJobResult(
	uint8 DeviceIndex	
Service ID[hex]:	0x06	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	DeviceIndex	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	Memlf_JobResultType	
Description:	map function calls of MemIf_GetJobResult to service: Fee_GetJobResult	
	respectively Ea_GetJobResult	

MemIf053: The function MemIf_GetJobResult shall be mapped to service: Fee_GetJobResult respectively Ea_GetJobResult.

8.3.7 Memlf InvalidateBlock

Memlf044:

Service name:	Memlf_InvalidateBlock	
Syntax:	Std_ReturnType MemIf_InvalidateBlock(uint8 DeviceIndex, uint16 BlockNumber)	
Service ID[hex]:	0x07	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	DeviceIndex	

	BlockNumber	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	Std_ReturnType	
Description:	map function calls of MemIf_InvalidateBlock to service: Fee_InvalidateBlock	
	respectively Ea_InvalidateBlock	

MemIf054: The function MemIf_InvalidateBlock shall be mapped to service: Fee_InvalidateBlock respectively Ea_InvalidateBlock.

8.3.8 Memlf GetVersionInfo

Memlf045:

Service name:	MemIf_GetVersionInfo
Syntax:	void MemIf_GetVersionInfo(
	Std_VersionInfoType* VersionInfoPtr
Service ID[hex]:	0x08
Sync/Async:	Synchronous
Reentrancy:	Reentrant
Parameters (in):	None
Parameters	None
(inout):	
Parameters (out):	VersionInfoPtr Pointer to standard version information structure.
Return value:	None
Description:	Returns version information.

MemIf031: The function MemIf_GetVersionInfo shallreturn synchronously the version information on the Memory Abstraction Interface module in the structure provided by the caller.

MemIf057: Configurations: The function MemIf_GetVersionInfo is only available if enabled by the pre-processor switch MemIfVersionInfoApi.

8.3.9 Memlf_EraseImmediateBlock

Memlf046:

Service name:	MemIf_EraseImmediateBlock	
Syntax:	Std_ReturnType MemIf_EraseImmediateBlock(
	uint8 DeviceIndex,	
	uint16 BlockNumber	
Service ID[hex]:	0x09	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Doromotoro (in)	DeviceIndex	
Parameters (in):	BlockNumber	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	Std_ReturnType	

Description:	map function calls of MemIf_EraseImmediateBlock to service:
	Fee_EraseImmediateBlock respectively Ea_EraseImmediateBlock

MemIf055: The function MemIf_EraseImmediateBlock shall be mapped to service: Fee_EraseImmediateBlock respectively Ea_EraseImmediateBlock.

8.4 Call-back notifications

None, the NVRAM manager shall provide the callback routines for the underlying memory abstraction modules.

8.5 Scheduled functions

None, there are no asynchronous functions in this module.

8.6 Expected Interfaces

8.6.1 Mandatory Interfaces

This chapter defines all interfaces which are required to fulfill the core functionality of the module.

Memlf047:

API function	Description
Ea_Cancel	Cancels the ongoing asynchronous operation.
Fee_Cancel	Service to call the cancel function of the underlying flash driver.
Fee_GetStatus	Service to call the GetStatus function of the underlying flash driver.
Fee_Write	Service to initiate a write job.
Ea_SetMode	Sets the mode.
Ea_GetJobResult	Service to return the JobResult.
Fee_Read	Service to initiate a read job.
Ea_InvalidateBlock	Invalidates the block BlockNumber.
Fee_SetMode	Service to call the Fls_SetMode function of the underlying flash driver.
Ea_GetStatus	Service to return the Status.
Fee_GetJobResult	Service to call the GetJobResult function of the underlying flash driver.
Fee_InvalidateBlock	Service to invalidate a logical block.
Ea_Read	Reads Length bytes of block Blocknumber at offset BlockOffset into the
	buffer DataBufferPtr.
Ea_EraseImmediateBlock	Erases the block BlockNumber.
Fee_EraseImmediateBlock	Service to erase a logical block.
Ea_Write	Writes the contents of the DataBufferPtr to the block BlockNumber.

8.6.2 Optional Interfaces

This chapter defines all interfaces which are required to fulfill an optional functionality of the module.

Memlf048:

API function	Description
Det_ReportError	Service to report development errors.

8.6.3 Configurable interfaces

In this chapter all interfaces are listed where the target function could be configured. The target function is usually a call-back function. The names of these kind of interfaces is not fixed because they are configurable.

There are no configurable interfaces for this module.

9 Sequence diagrams

Refer to the specifications of the memory abstraction modules.

10 Configuration specification

10.1 How to read this chapter

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture
- AUTOSAR ECU Configuration Specification
 This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration metamodel in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

10.1.1 Configuration and configuration parameters

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term "configuration class" (of a parameter) shall be used in order to refer to a specific configuration point in time.

10.1.2 Containers

Containers structure the set of configuration parameters. This means:

- all configuration parameters are kept in containers.
- (sub-) containers can reference (sub-) containers. It is possible to assign a multiplicity to these references. The multiplicity then defines the possible number of instances of the contained parameters.

10.1.3 Specification template for configuration parameters

The following tables consist of three sections:

- the general section
- the configuration parameter section
- the section of included/referenced containers

Pre-compile time

 specifies whether the configuration parameter shall be of configuration class *Pre-compile time* or not

Label	Description
Х	The configuration parameter shall be of configuration class <i>Pre-compile time</i> .
	The configuration parameter shall never be of configuration class <i>Pre-compile time</i> .

Link time

- specifies whether the configuration parameter shall be of configuration class *Link time* or not

Label	Description
Х	The configuration parameter shall be of configuration class <i>Link time</i> .
	The configuration parameter shall never be of configuration class <i>Link time</i> .

Post Build

 specifies whether the configuration parameter shall be of configuration class Post Build or not

Label	Description
х	The configuration parameter shall be of configuration class <i>Post Build</i> and no specific implementation is required.
L	Loadable - the configuration parameter shall be of configuration class Post Build and only one configuration parameter set resides in the ECU.
М	Multiple - the configuration parameter shall be of configuration class Post Build and is selected out of a set of multiple parameters by passing a dedicated pointer to the init function of the module.
	The configuration parameter shall never be of configuration class Post Build.

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 0.

10.2.1 Variants

No variants specified.

10.2.2 Memlf

Module Name	Memlf
Module Description	Configuration of the MemIf (Memory Abstraction Interface) module.

Included Containers		
Container Name	iner Name Multiplicity Scope / Dependency	
MemIfGeneral	l I	Configuration of the memory abstraction interface (Memif) module.

10.2.3 MemlfGeneral

SWS Item	Memlf025 :
Container Name	MemIfGeneral{MemIf_Configuration}
Description	Configuration of the memory abstraction interface (Memif) module.
Configuration Parameters	

SWS Item	
Name	MemlfDevErrorDetect {MEMIF_DEV_ERROR_DETECT}

Description	Pre-processor switch to enable and disable development error detection. true: Development error detection enabled. false: Development error detection disabled.			
Multiplicity	1	1		
Type	BooleanParamDef	BooleanParamDef		
Default value				
ConfigurationClass	Pre-compile time	X	All Variants	
	Link time			
	Post-build time			
Scope / Dependency				

SWS Item				
Name	MemIfNumberOfDevices {MEMIF_NUMBER_OF_DEVICES}			
Description	Concrete number of under	ying me	emory abstraction modules.	
Multiplicity	1	1		
Туре	DerivedIntegerParamDef			
Range	1 255

10.3 Published Information

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

The standard common published information like

vendorId (<Module>_VENDOR_ID),
moduleId (<Module>_MODULE_ID),

```
arMajorVersion (<Module>_AR_MAJOR_VERSION), arMinorVersion (<Module>_ AR_MINOR_VERSION), arPatchVersion (<Module>_ AR_PATCH_VERSION), swMajorVersion (<Module>_SW_MAJOR_VERSION), swMinorVersion (<Module>_ SW_MINOR_VERSION), swPatchVersion (<Module>_ SW_PATCH_VERSION), vendorApiInfix (<Module>_VENDOR_API_INFIX)
```

is provided in the BSW Module Description Template (see [10] Figure 4.1 and Figure 7.1).

Additional published parameters are listed below if applicable for this module.

11 Changes during SWS Improvements by Technical Office

11.1 Deleted SWS Items

None

11.2 Replaced SWS Items

None

11.3 Changed SWS Items

SWS Item	Rationale	
Memlf022	RfC #17179: Requirement extended to encompass the broadcast identifier.
